**FläktWoods**

**AXICO ANTI-STALL®**  
**FPAC and FPMC axial-flow fans**

For variable air flow by means of controllable pitch blades.

The fans have completely stable flow/pressure characteristics, which eliminates the risk of surging.

Air flow range: 3 - 110 m³/s (10 000 - 400 000 m³/h).

Pressure rise: Up to 3000 Pa.

Air temperature range: -15 to + 40°C with regard to the insulation class of the motor.  
 A quotation for a special version for other temperatures will be submitted on request.

- Good operating economy
- Surge-free operation
- Good control economy - the fan blades are instantly set to meet the flow requirements of the installation, without impairing the high efficiency
- Choice of suitable hub diameter and blade angle for optimum matching to the desired operating point
- Standard 4-pole or 6-pole foot-mounted motor or two-speed motor
- Low vibration level
- Low mass-moment of inertia - short starting time
- Short overall length
- Complete range of accessories
- Surface treated with 80-micron coat of alkyd paint

The FPAC-1 axial-flow fan with CD guide vane diffuser.

**Applications**

**Comfort ventilation**

Air handling units with **AXICO ANTI-STALL®** fans are used principally in hospitals, offices, hotels, exhibition halls, sports arenas, shopping centres and similar buildings. All efforts are being made to achieve maximum compactness of conventional modular air handling units, in order to minimize building costs and space requirements. The **AXICO ANTI-STALL® CD** range of fans has been developed specifically for such air handling units. CD stands for compact design. To make the fan as compact as possible, the guide vane section is integrated with a diffuser. The CD converts dynamic pressure into static without adding the length of a separate diffuser. Its short overall length makes the **AXICO ANTI-STALL® CD** fan eminently suitable for all air handling units.

**Process ventilation**

What we normally recognize as process ventilation is the type of ventilation used in industrial plants, power stations, mines, paint shops clean rooms, offshore installations, garages and so on. Common criteria of all these plants are the strict demands as to factors such as reliability, resistance to corrosive environments (temperature, humidity), stable operating characteristics, spark-proof design and control accuracy. **AXICO ANTI-STALL®** fans usually meet the industrial requirements and can be adapted to meet specific requirements regarding materials, surface treatment, spark-proof design, special motors, special designs, etc. For particulars of the special variants available, consult your nearest Fläkt Woods AB representative.

## Design

The fan is supplied as a complete unit consisting of a casing with stabilizing ring, guide vane assembly, impeller, blade pitch control mechanism, guard, motor to IEC standard, and motor stand. Anti-vibration mountings of high damping rubber type and a flexible duct of PVC-coated nylon fabric for connection to an outlet duct are supplied.

In arrangement 6, the fan is also supplied with a flexible duct on the suction side.

The unique stabilizing ring controls and stabilizes the turbulence occurring in a heavily throttled fan. An axial fan without this stabilizing ring would be forced to surge, which may eventually lead to material fatigue and operation disturbances.

### The fan is available in two versions:

**FPAC** The blade angle is controlled by a diaphragm motor located in the hub of the impeller. The diaphragm motor is pneumatically actuated by means of a positioner. The FPAC offers accurate control of the blade angle, combined with fast response. The positioner operates with a pneumatic input signal or with an electric input signal as an option.

**FPMC** The blade angle is controlled by an electromechanic actuator operating on a control lever. The actuator is an accessory which, when ordered simultaneously with the fan, is fitted to the outside of the casing.

## Materials and finish

The main components of the impeller (hub, blades, etc.) are made of cast aluminium alloy. The control disc is made of cast iron. Other components of the fan, such as casing, stand, fasteners, shafts, etc., are mainly made of steel.

The fan is painted with an 80-micron thick coat of blue alkyd paint. The fasteners are galvanized.

### Environmental class C1, ISO 9223

Fans to higher environmental class up to and including C4 are available to special order.

### Installation

The fan is to be mounted on the supplied anti-vibration mountings which are secured to the floor. Instructions are submitted with the fan.

### Packaging

The fan is delivered on a pallet, and is protected with plastic sheeting.

## Arrangements available

### Arrangement 1

The fan impeller is mounted directly on the motor shaft. This is a compact arrangement which is particularly suitable for air handling units.

### Arrangement 3

The impeller is belt-driven for high total pressure capacity. For particulars of speeds, see the motor table on page 20. The motor is slidably mounted on a base frame, which makes the belt tension easy to adjust. The belt drive is provided with a galvanized steel guard.

### Arrangement 6

Horizontal

The impeller is mounted directly on the motor shaft. This arrangement is intended for connection to ducting on both sides. The FPAZ-21 inlet is used for open-suction installation. The fan can also be installed vertically.

Vertical, with upward direction of air flow

Vertical, with downward direction of air flow

### Arrangement 7

The impeller is mounted on an intermediate shaft connected to the motor by means of a highly elastic flexible coupling. The intermediate shaft is journaled in two bearing blocks. Grease nipples for periodic lubrication of the bearings are provided on the outside of the fan and are easily accessible. The motor can easily be replaced without the impeller and control components being disturbed.

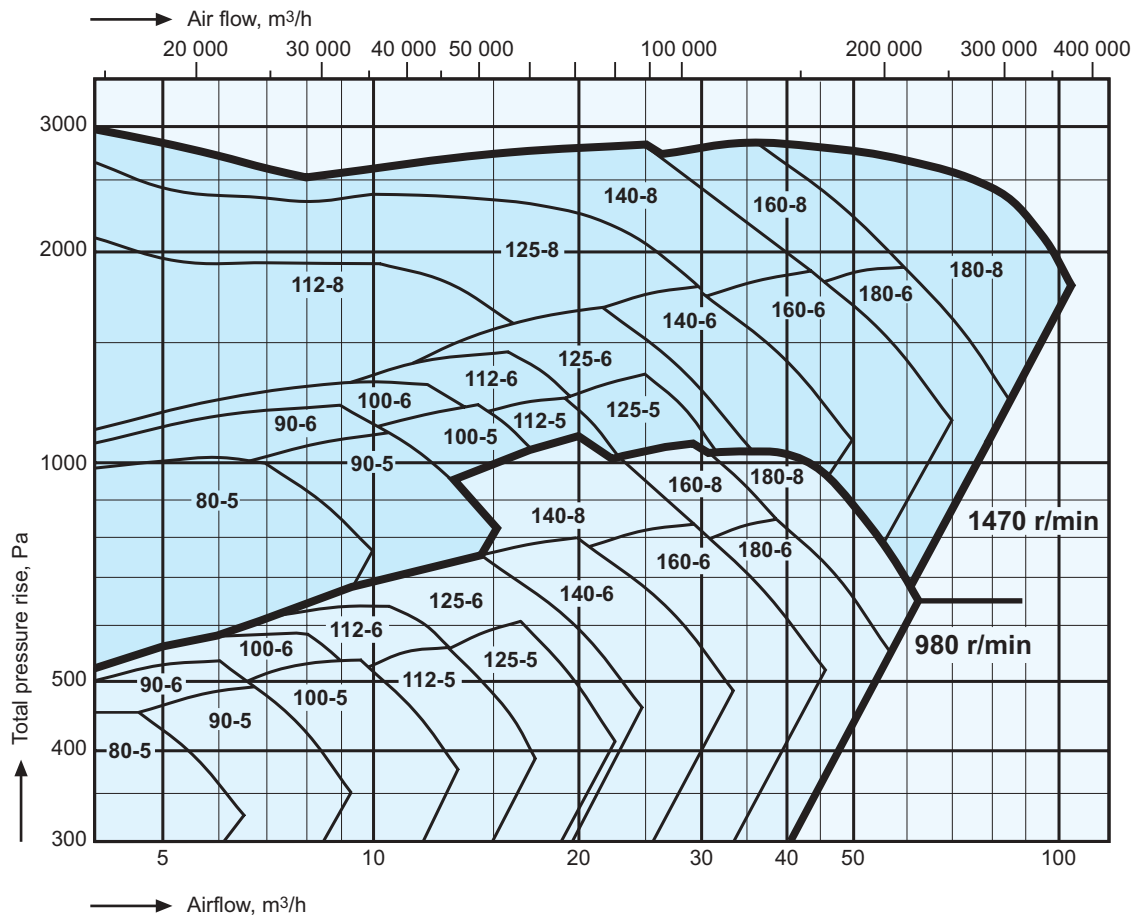

**General survey chart**

The chart is applicable to gas with a density of 1.2 kg/m<sup>3</sup>

## Accessories (to be specified separately)

### AXICO ANTI-STALL® CD (compact design)

**FPAZ-01, FPMZ-01 guide vane diffusers of CD design**, mounted on the fan instead of the cylindrical guide vane unit. This minimises the overall length of the fan/diffuser installation, at the same time reducing the air velocity. The guide vane diffuser is made of sheet steel and is provided with the same surface treatment as the fan.

The **CD version** is particularly suitable wherever a short overall length is important, such as in an air handling unit.

**FPAZ-02 diffuser** is particularly suitable wherever a short overall length is important, such as in an air handling unit.

**FPAZ-03 long diffuser** of galvanized sheet steel for connection to the fan outlet by means of a flexible duct. The diffuser reduces the air velocity to a suitable level for connection to the ducting or to a plenum chamber. The FPAZ-03 converts the dynamic pressure to static pressure at high efficiency, so that a maximum of the pressure generated by the fan will be utilized.

Note. *The FPAZ-02 together with the FP(A,M)Z-01 CD diffusers provides a dynamic pressure recovery equal to that of the FPAZ-03, but within a shorter overall length.*

**FPAZ-04 air distributor** for connection directly downstream of the AXICO fan. The FPAZ-04 distributes the air with a uniform velocity profile over a large area. The distributor has a very short overall length and low pressure loss. The connection loss is shown in the chart, Fig. 1 on page 9. Due to the low pressure loss, the air distributor is particularly suitable as a transition piece for connection to a heating coil or baffle-type silencer.

**FPAZ-05 air distributor** for connection downstream of the FPAZ-01 or FPMZ-01 guide vane diffuser or FPAZ-02, -03, or -25 diffuser. Features, see FPAZ-04.

Note. *The FPAZ-06 transition piece must be ordered for connecting the air distributor to the FP(A,M)Z-01 guide vane diffuser.*

**FPAZ-06 transition piece** for connecting the FPAZ-05 air distributor directly to an FP(A,M)Z-01 guide vane diffuser. The transition piece is made of sheet steel and is provided with the same surface treatment as the fan.

**FPAZ-21 inlet with protective grille** is intended for arrangement 6 and free inlet installation.  $\Delta p = 0.15 \times p_d$ .

**FPAZ-24 silencer** is designed for horizontal or vertical installation. The entire silencer is made of galvanized sheet steel. The internal sheet-steel liners including that of the central core are perforated and are provided with sound-absorbing mineral wool behind the perforations. The silencer is to be connected to the ducting by means of a flexible duct.

Flexible ducts should be used for connection to the fan, and an appropriate number of flexible ducts is delivered with the fan.

An arrangement 6 fan can be installed with silencers on both sides. For particulars of the pressure drop across the silencer, the total sound attenuation in dB(A) and the division into different octave bands, see page 31.

Silencers can be sized and supplied to suit special applications. For further particulars, consult your nearest Fläkt Woods representative.

**FPAZ-25 acoustic diffuser** provides sound attenuation and is designed for connection to a flexible duct. The diffuser reduces the air velocity to a suitable level for connection to ducting or to a plenum chamber. The dynamic pressure is converted at high efficiency to static pressure, so that a maximum of the pressure generated by the fan will be utilised. The outer casing of the diffuser is made of painted sheet steel, while the inner casing and centre element are made of galvanized, perforated sheet steel. The diffuser casing and centre element incorporate sound-absorbing mineral wool. The design provides a high degree of sound attenuation, above all within the octave bands between 500 and 4000 Hz (see the table on page 32).

Note. *The galvanized sheet steel mentioned above is sheet steel which has been galvanized in accordance with the Sendzimir method. This process results in a coating of 275 g of zinc per m<sup>2</sup> of sheet, which provides a zinc coating of approx. 20 µm (microns) per side.*

**FPAZ-33 flexible duct** for flange-sleeve connection is used for adapting the FPAZ-24 sound absorber when a flanged connection is required.

**EBGA counterflange** for the outlet diffuser. The dimensions are in accordance with ISO 6580 and EUROVENT 1/2 (see page 32).

**EBGV grouting-in-frame** for the outlet diffuser. The dimensions are in accordance with ISO 6580 and EUROVENT 1/2. (see page 32).

**FPMZ-07, FPMZ-09 and FPMZ-13 actuators** are designed for electric control of the blade angle (see page 28).

**FPAZ-14 electro-pneumatic positioner** to be used when a 4-20 mA signal is specified to control an FPAC fan. The positioner can be used together with FPAZ-16 pressure control equipment, for instance.

**FP(A,M)Z-16 control equipment** is a complete system for automatic control of one or two AXICO fans. The system provides a constant pressure at the measuring point. The system can be used for supply air fans as well as for exhaust air fans.

The **FPAZ-16** system is intended for the FPAC fan with pneumatic control, which has been equipped with the FPAZ-14 electro-pneumatic positioner. The FPAZ-16 is also well suited for use with actuators having continuous input signal: FPMZ-07-2, FPMZ-09-2 or FPMZ-13-2, for instance. It consists basically of a controller with built-in pressure sensor.

The FPAZ-16 is enclosed in a cabinet on delivery. Fitting components for distances up to 25 m between the controller and the measurement point are supplied.

### Technical particulars, setting range:

FPAZ-16 -05	0 - 500 Pa
-10	50 - 1000 Pa
-20	100 - 2000 Pa

Connection: 8 mm o.d./6mm i.d. plastic hose for compressed air.

Power supply: 220 V, 50 Hz, 5 A fuse

Cabinet: 380 mm wide x 300 mm high x 155 mm deep.

Degree of protection: IP 66

The FPMZ-16 is intended for the FPMC fan which has been equipped with a pulse-type, electro-mechanical actuator, FPMZ-07-1, FPMZ-09-1 or FPMZ-13-1, for instance. It consists basically of a controller with built-in pressure sensor.

The FPMZ-16 is enclosed in a cabinet on delivery.

Fitting components for distances up to 25 m between the controller and the measurement point are supplied.

### Technical particulars, setting range:

FPMZ-16 -05	0 - 500 Pa
-10	50 - 1000 Pa
-20	100 - 2000 Pa

Power supply: 230 V, 50/60 Hz, 5 A fuse

Cabinet: 380 mm wide x 300 mm high x 155 mm deep.

Degree of protection: IP 66

The **FPAZ-70** is a complete system for automatic air flow control of free inlet, type FPAC-1 and FPAC-7 AXICO fans.

The system can be easily adapted to control several fans operating in parallel.

The FPAZ-70 has an input for external set point value and a flow-linear actual value output.

Current air flow readings in m<sup>3</sup>/s or differential pressure readings are shown on a display, via a selector switch.

The equipment utilises air flow measurements in the fan inlet as actual values and must therefore be used in combination with the FPAZ-18. The flow is indicated as a static differential pressure between the fan inlet and the fan room. This is contingent on the fan size and should be known when ordering.

The following measurement ranges exist:

FPAZ-70 -05	0 - 500 Pa
-10	50 - 1000 Pa
-20	100 - 2000 Pa

Power supply: 230 V single-phase, 50/60 Hz, 5 A fuse  
 Dimensions: 380 mm wide x 300 mm high x 155 mm deep.  
 Degree of protection: IP 66

**FPAZ-17 flow measurement transmitter**

The transmitter measures the flow in the fan inlet and must therefore be used in combination with the FPAZ-18.  
 Current air flow readings in m³/s or differential pressure readings are shown on a display, via a selector switch. The flow is indicated as a static differential pressure between the fan inlet and the fan room.  
 The differential pressure is contingent on the fan size and should be known when ordering.

The following measurement ranges exist:

FPAZ-17 -05	0 - 500 Pa
-10	50 - 1000 Pa
-20	100 - 2000 Pa

The 4 - 20 mA output signal is proportional to the flow.  
 Power supply: 220 V single-phase, 50 Hz, 5 A fuse  
 Cabinet: 200 mm wide x 300 mm high x 155 mm deep.  
 Degree of protection: IP 55

**FPAZ-18 flow measurement tapping** for pressure measurement at the inlet of a free inlet fan, for measuring the static pressure differential between the inlet and the surroundings (fan room). Using the FPAZ-17 converter, this can be presented as a flow in m³/s.

**FPAZ-19 blade angle indicator** provides continuous indication of the actual blade angle of an FPAC fan and is factory-mounted near the positioner.

**FPMZ-19 blade angle indicator** provides continuous indication of the actual blade angle of an FPMC fan and is factory-mounted near the control lever.

Fig. 1 shows the connection loss  $\Delta p$  for all sizes of the FPAZ-04 air distributor connected directly to the fan. The total pressure rise  $\Delta p_t$  across the fan is obtained by adding  $\Delta p$  to the static pressure drop  $\Delta p_s$  across the installation.

$\Delta p_t = \Delta p_s + \Delta p$   
 $p_d = \text{dynamic pressure} \approx 0$

Example:  
 For a size 125 - 6 fan and a flow rate of 20 m³/s, the pressure loss will be 150 Pa.

Fig. 2 shows the connection loss  $\Delta p$  of the FPAZ-03<sup>1)</sup> diffuser combined with the FPAZ-05 air distributor. The total pressure rise  $\Delta p_t$  of the fan is obtained by adding  $\Delta p$  to the static pressure drop  $\Delta p_s$  across the installation.

$\Delta p_t = \Delta p_s + \Delta p$   
 $p_d = \text{dynamic pressure} \approx 0$

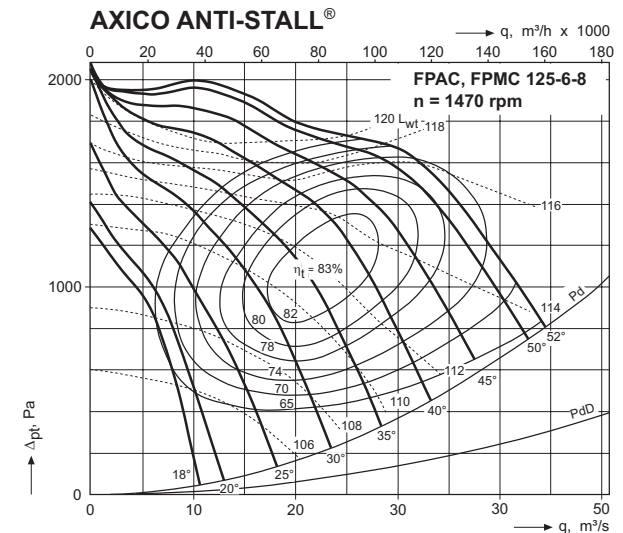

Example:  
 For a size 125 - 6 fan and a flow rate of 20 m³/s, the total loss across the diffuser and air distributor will be 66 Pa.

<sup>1)</sup> The connection loss of the FPAZ-05 air distributor in combination with the FPAZ-01 or FPMZ-01 diffuser, of CD design, is shown as  $\Delta p_2$  in each fan chart.

**Aspects of fan selection**

AXICO fans are characterized by high efficiency over a wide operating range. The design load should be selected far to the right in the charts. This can be done if the connection loss is restricted, such as by using a diffuser and air distributor. The normal operating points at partial loads will then also be located in the high-efficiency zone. The curves in the AXICO ANTI-STALL<sup>®</sup> pressure/flow charts are perfectly stable. The risk of surging (i.e. instability of the fan pressure and consequent pressure fluctuations) encountered on conventional vane axial fans is thus completely eliminated. The performance of the AXICO fan will therefore be maintained stable even in the event of the system resistance increasing more than expected. The maximum blade angle specified in the fan charts is the maximum angle for which the fan is designed.

## Sizing

The charts are applicable to air with a density of 1.2 kg/m<sup>3</sup>. The pressure/flow characteristic of the fan is presented as a total pressure rise  $\Delta p_t$  between the fan inlet and the fan outlet, provided that the fan is connected to ducting having the same diameter as that of the fan. The charts are applicable to both free inlet fans and fans connected to ducting, and do not include any belt drive loss. The capacities and acoustic data in the charts are based on measurements in accordance with the AMCA 210-85 and AMCA 300-85 (Air Movement and Control Association Inc.) methods respectively. The connection of the fan may vary, depending on the design of the ventilation system and the requirements. The outlet side of the fan is often connected across a diffuser to a plenum chamber or a duct. Combinations of CD diffuser, air distributor and silencer offer benefits in terms of space required, low sound level, overall economy, etc. The connection losses for connection cases other than that of connection directly to the ducting can be read on the scales at the right-hand bottom.

The connection case may be one of the following five:

- ①  Fan connected directly to a duct.  
The connection loss is included in the chart.  
 $\Delta p_t = \Delta p_s + p_d$
- ②  CD fan with an FP(A,M)Z-01 guide vane diffuser connected to a plenum chamber.  
 $\Delta p_t = \Delta p_s + \Delta p_1$
- ③  CD fan with an FP(A,M)Z-01 guide vane diffuser and FPAZ-05 air distributor connected to a duct.  
 $\Delta p_t = \Delta p_s + \Delta p_2$
- ④  Fan connected to a plenum chamber across a FPAZ diffuser.  
 $\Delta p_t = \Delta p_s + \Delta p_3$
- ⑤  Fan connected to a duct across a FPAZ diffuser.  
 $\Delta p_t = \Delta p_s + \Delta p_4 + p_{dD}$

- $\Delta p_t$  = total pressure rise across the fan (from chart)
- $\Delta p_s$  = static pressure rise across the installation
- $\Delta p_1, \Delta p_2, \Delta p_3, \Delta p_4$  = connection loss
- $p_d$  = dynamic pressure in the connected duct
- $p_{dD}$  = dynamic pressure in the connected duct after diffuser

Connection cases ① and ⑤ presuppose that the straight section of duct, downstream of the fan or diffuser, has a length of at least 2.5 times the nominal diameter of the fan or diffuser. The connection loss in an installation with a type FPAZ-04 or FPAZ-05 air distributor can be read from the chart on page 7.

Two curves showing the dynamic pressure are plotted in the fan charts:

- $p_d$ : In a duct with an area corresponding to the nominal diameter of the fan, e.g. 1250 mm diameter for a size 125 fan. This corresponds to connection case ①.
- $p_{dD}$ : In a duct with an area corresponding to the outlet diameter of the FPAZ-03 diffuser. This corresponds to connection case ⑤.

The fan charts apply to fans with free inlet as well as to ducted inlet. For arrangement 1 and arrangement 6 fans with FPAZ-21 inlet, add a loss of  $0.15 \times p_d$  for the protective grille. See also page 11.

## Example of fan selection

### Given:

A fan operating under variable flow and pressure conditions with the outlet connected to a duct across a diffuser (connection case ⑤).

Max. air flow: 30 m<sup>3</sup>/s. Normal load: 20-25 m<sup>3</sup>/s. Static pressure rise from fan inlet to duct: 1200 and 700-850 Pa respectively. Air density: 1.2 kg/m<sup>3</sup>.

If compressed air is available for the control, select the FPAC fan. Otherwise, select the FPMC with an electric actuator. See page 28 for the control force and selection of actuator.

### Solution:

Assume 150 Pa for the dynamic pressure and connection loss, which is added to the required static pressure. From the general survey chart on page 5, a size 125-6 fan with a 4-pole motor is selected. The following particulars can be obtained from the fan chart for this size.

Operating conditions	Flow m <sup>3</sup> /s		
	30	25	20
1) Density ..... kg/m <sup>3</sup>	1.2	1.2	1.2
2) Static pressure rise ..... Pa	1200	850	700
3) Speed ..... rpm	1470	1470	1470
4) Dynamic pressure in the duct ..... Pa	130	90	60
5) Connection loss ..... Pa	58	40	25
6) Total pressure rise across the fan ..... Pa	1388	980	785
7) Blade angle ..... degrees	47	37	31
8) Efficiency ..... %	81	82	81
9) Power demand ..... kW	51.4	29.9	19.4
10) Suitable motor rating ..... kW	55		
11) Max. blade angle ..... degrees	48		
12) Total sound power level ..... dB(A)	115	112	109
13) Annual operating time ..... h	250	2000	2000

**Sizing (contd.)**

Annual operating cost:  
 $(51.4 \times 250 \text{ h} + 29.9 \times 2000 \text{ h} + 19.4 \times 2000 \text{ h}) \times \text{cost per kWh.}$

Items 1 - 13 in the above table are derived as follows:

- 1, 2) Given
- 3) From the general survey chart (page 5).
- 4) Read from the chart curves for dynamic pressure.  
The lower curve applies in this example, p<sub>dD</sub>, since a diffuser is included.
- 5) Read from the fan chart scales for the connection loss Δp<sub>4</sub>.
- 6) The required static pressure rise, the dynamic pressure plus connection loss read from the chart.
- 7, 8) Read from the chart - at the intersection of the given flow and the total pressure rise across the fan.
- 9) Read from the power chart - at the intersection of the given flow and the blade angle. Power is more accurately determined from the expression.

Power demand, kW =

$$\frac{\text{Flow, m}^3 \times \text{Total pressure rise across the fan, Pa}}{10 \times \text{Efficiency, \%}}$$

- 10) The maximum power demand from 9) above is 51.4 kW. Select a 55 kW motor which gives little margin for any increase in flow and rise in system resistance in relation to the calculated value. The next larger size of motor may be advisable.
- 11) When delivered from the factory, the AXICO ANTI-STALL® is fitted with mechanical stops which limit the blade angle to prevent overloading of the motor. Since the operating conditions vary from system to system in terms of temperature, density and system characteristics, the maximum blade angle required should be specified in the order. In the absence of this information, the maximum blade angle will be set to suit the motor rating. For an operating point along the same throttling curve, the maximum blade angle is 48°, since the motor rating is limited to 55 kW.
- 12) Read from the chart - at the intersection of the given flow and the total pressure rise across the fan.
- 13) To be specified by the customer.

**Example of connection cases**

As a means of demonstrating the differences in total pressure and power demand contingent on the connection case selected for a given system, a comparison between connection cases 1, 2, 3, 4 and 5 is presented in the table below.

The connection losses have been obtained from the appropriate scale and the dynamic pressure from the appropriate curve in the fan chart.

Note that different total pressures may give varying fan efficiencies, which will affect the overall economy.

Connection case	1	2	3	4	5
Flow ..... m <sup>3</sup> /s	25	25	25	25	25
Static pressure rise ..... Pa	850	850	850	850	850
Dynamic pressure ..... Pa	250	-	-	-	90
Connection loss ..... Pa	-	250	190	165	40
Total pressure rise across the fan ..... Pa	1100	1100	1040	1015	980
Fan output ..... kW	33	33	32	31	30

**Control**

The AXICO ANTI-STALL® is easily controlled so that it delivers the required flow in all situations. Suitable controllers include pulse controllers with variable pulse duration and neutral zone, or PI controllers with a P band of 80% or more. The sensor (transmitter) should be selected so that the controlled variable is approx. 70-90% of the maximum limit of the sensor.

The AXICO ANTI-STALL® can be adapted to the control signals that are standard in computerised control systems.

**FPAC fans**

**N.B. The fan includes a diaphragm motor and positioner (see below). Although other (external) control equipment is not included, it is available as the FPAZ-16 accessory.**

The blade pitch of the FPAC fan can be varied while the fan is running. This is done by means of a built-in diaphragm motor which is actuated by compressed air through a rotary coupling.

When the pressure at the diaphragm motor is atmospheric, the blades are in the minimum position, i.e. the fan delivers minimum air flow.

As the pressure at the diaphragm motor increases, the blade angle will change and the air flow through the fan will increase.

The position of the diaphragm motor is controlled by a linear positioner which eliminates hysteresis in controlling the blades, and the blade angles will therefore change linearly with the input control signal.

The positioner is available in two versions: either with a 20-100 Pa pneumatic control signal or with a 0-20/4-20mA electric control signal. The latter is optional, see accessory FPAZ-14 (and FPAZ-16).

In addition, the positioner has one input for the air supply to the diaphragm motor. The air should basically be free from oil, water and other impurities, i.e. it should be of instrument quality (air that contains no particles larger than 10 μm (microns) and has a dew point of -20°C or below.

For particulars of pressures, see page 28. Pressures above 550 kPa (5.5 atg.) should be avoided.

The air demand varies with the number of changes in position and the magnitudes of the changes. On average, about 0.3 l/s of air at s.t.p. is required. At an operating pressure of 400 kPa, 0.18 l/s of air is required when the positioner is at rest, and about 1.5 l/s of air is needed for the maximum stroke.

**FPMC fans**

The blades of FPMC fans are turned by linkage system actuated by an external motor. For particulars of control forces and actuators, see the table on page 28. The actuator must be ordered separately and is available as an accessory.

External control equipment, see accessory FPMZ-16.

**Examples of control equipment, see page 10.**

## Examples of control equipment

### Operation with one fan

The most common and simplest way of controlling the fan of a supply air system with varying flow requirements is to maintain a constant pressure in a plenum chamber or in the supply air duct. For the FPAC, e.g. FPAZ-16-bb, see Fig. 1.

For the FPMC, e.g. FPMZ-16-bb, see Fig. 2.

Exhaust air fans are controlled in the same manner, but with the pressure sensor located in a suction chamber (i.e. the fan room) or in exhaust air duct.

Fig. 1

- PC = Pressure controller (with built-in pressure sensor)
- PX = Pneumatic positioner or electro-pneumatic positioner (see page 9)
- IG = Integration vessel
- Rd = Reducing stations

Fig. 2

- PC = Electronic pressure controller (with built-in pressure sensor)
- MS = Electro-mechanic actuator
- IG = Integration vessel

### Parallel operation of the FPAC

This is done by the signal from converter PC (Fig. 1) being branched off to the positioners PX of two or more fans.

### Parallel operation of the FPMC

Two fans can be controlled in parallel by the second fan being on follower control via a servo controller. The actuators of both fans must be equipped with potentiometers (see Fig. 3).

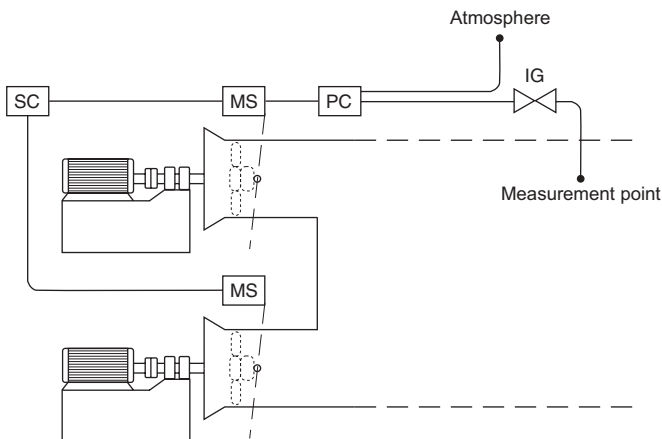

Fig. 3

- PC = Electronic pressure controller (with built-in pressure sensor)
- SC = Electronic servo controller
- MS = Electric actuator
- IG = Integration vessel

## Supply and exhaust air system

It may sometimes be beneficial to control a supply air fan and an exhaust air fan so that the air flows delivered by the two fans follow one another.

The supply air fan is controlled in the conventional manner, so that the pressure in the plenum chamber or duct is maintained constant. By measuring the flow through each fan, the exhaust air fan can be controlled to follow the supply air fan exactly or with a predetermined flow differential (see Fig. 4)

Fig. 4

- PC = Electronic pressure controller
- MS/PX = Electro-mechanic actuator/electro-pneumatic positioner
- FC = Electronic flow controller
- FT = FPAZ-17 Linear electronic pressure transmitter in combination with FPAZ-18
- IG = Integration vessel

## Supply and exhaust air systems with parallel fans

Two parallel fans for supply air and two parallel fans for exhaust air (a total of 4 fans) should be controlled by two separate control systems.

## Fan charts

The charts are applicable to gas with a density of 1.2 kg/m<sup>3</sup> and do not include belt drive loss.

- Arr. 3 and 7 Apply including protective grille
- Arr. 1 A connection loss of 0.15 × p<sub>d</sub> must always be added for the protective grille.
- Arr. 6 On free inlet fans with FPAZ-21 protective grille, a connection loss of 0.15 × p<sub>d</sub> must be added

### Symbols used

- ① = fan size and speed
- ② q, m<sup>3</sup>/s (h) = air flow
- ③ Δp<sub>t</sub>, Pa = total pressure rise, from the inlet to the entire outlet area
- ④ P, kW = power demand
- ⑤ degrees = blade root setting angle
- ⑥ η<sub>t</sub>, % = maximum overall efficiency of the fan
- ⑦ η, % = overall efficiency of the fan
- ⑧ L<sub>wt</sub>, dB(A) = total sound power level
- ⑨ P<sub>d</sub>, Pa = dynamic pressure in the duct with the same diameter as the fan outlet
- ⑩ P<sub>dD</sub>, Pa = dynamic pressure in the duct with the same diameter as the outlet of the FPAZ-02, -03 and -25 diffuser
- ⑪ Δp<sub>1</sub>, Pa = connection loss for a fan of CD-design with FP(A,M)Z-01 guide vane diffuser connected to a large chamber
- ⑫ Δp<sub>2</sub>, Pa = connection loss for a fan with FP(A,M)Z-01 guide vane diffuser and FPAZ-05 air distributor fitted to a duct
- ⑬ Δp<sub>3</sub>, Pa = connection loss for a fan with diffuser fitted to a large chamber
- ⑭ Δp<sub>4</sub>, Pa = connection loss for fan with diffuser fitted to a duct
- ⑮ J, kg m<sup>2</sup> = mass moment of inertia (=1/4 GD<sup>2</sup>)

**Motors, arrangements 1, 6 and 7 (to be ordered separately)**

112	6	225S - 315S	1800

## Ordering key

**Axial flow fan** (see note)

**FPAC-a-bbb-c-d-e-f**

**Axial flow fan** (see note)

**FPMC-a-bbb-c-d-e-f**

When placing the order, please state the max. blade angle in text (see point 11, page 11)

### Type

AC = pneumatic control  
MC = mechanical control

### Arrangement (a)

- 1 = Impeller mounted on motor shaft
  - for FPAC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 125-6-d-e-f
  - for FPMC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 125-6-d-e-f
- 3 = For belt-drive (belt drive to be ordered separately)
  - for FPAC, FPMC 080-5-d-e-f  
090-6-d-e-f  
100-6-d-e-f  
112-6-d-e-f

### 6 = Ducted fan

Horizontal installation:

- for FPAC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 180-6-d-e-f  
112 up to and incl. 180-8-d-e-f<sup>1)</sup>
- for FPMC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 125-6-d-e-f

Vertical installation:<sup>2)</sup>

- for FPAC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 180-6-d-e-f  
112 up to and incl. 180-8-d-e-f

### 7 = Impeller mounted on intermediate shaft

- for FPAC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 180-6-d-e-f  
112 up to and incl. 180-8-d-e-f
- for FPMC 080 up to and incl. 125-5-d-e-f  
090 up to and incl. 160-6-d-e-f

### Size (bbb)

080, 090, 100, 112, 125, 140, 160, 180

### Hub diameter (c)

5 = 500 mm, 6 = 630 mm, 8 = 800 mm

### Number of blades (d)

Number of blades on size/hub  
8 = 8 blades on 080/5 - 125/5, 090/6 - 180/6  
9 = 10 blades on 112/8 - 180/8

### Motor size (e)<sup>3)</sup>

0 = 132 S, M	5 = 250 M
1 = 160 M, L	6 = 280 S, M
2 = 180 M, L	7 = 315 S, M
3 = 200 L	8 = 315 L
4 = 225 S, M	9 = 355 S, M

### Design (f)

2 = all except FPAC-6, vertical  
3 = FPAC-6, vertical, upward air discharge  
4 = FPAC-6, vertical downward air discharge

### Guide vane diffuser, CD-version (for FPAC)

**FPAZ-01-bbb-c**

### Guide vane diffuser, CD-version (for FPMC)

**FPMZ-01-bbb-c**

### Diffuser, short (after CD guide vane diffuser)

**FPAZ-02-bbb-c**

### Diffuser, long (after fan)

**FPAZ-03-bbb-c**

### Air distributor<sup>4)</sup> (after fan)

**FPAZ-04-bbb-c**

### Air distributor<sup>4)</sup> (after diffusers, see page 6)

**FPAZ-05-bbb-c**

### Transition piece

**FPAZ-06-bbb**

(CD guide vane diffuser - air distributor)

Size = bbb in fan ordering key

Hub diameter = c in fan ordering key

1) Motor with angular contact bearings (for thrust loading on motor) for size/hub dia. 160/8 - 180/8

2) Motor with angular contact bearings (for thrust loading on motor) for upward direction of air discharge. FPMC will be quoted on request.

3) Check that the selected motor is included in the "Motors" table. See page 34.

4) If ordered separately, the air diffusers can be supplied in split condition to facilitate transport.

### Inlet with protective grille (only for arr. 6)

**FPAZ-21-bbb**

Size = bbb in fan ordering key

### Cylindrical silencer

**FPAZ-24-bbb-c**

Size = bbb in fan ordering key

Diameter of core (c)

0 = without core

5, 6, 8 = hub diameter = c in fan ordering key

### Acoustic diffuser (with sound attenuation)

**FPAZ-25-bbb-c**

Size = bbb in fan ordering key

Hub diameter = c in fan ordering key

### Flexible duct (for sound absorber)

**FPAZ-33-bbb**

Size = bbb in fan ordering key

### Counterflange (for diffuser outlet) \*

**EBGA-a-bbb**

### Grouting-in frame (for diffuser outlet) \*

**EBGV-a-bbb**

Materials and finish (a)

0 = unpainted, 1 = steel, painted

Size = bbb in fan ordering key. see \* below

\* NB. The outlet of FPAZ-02, 03 and -25 diffusers is two sizes larger than the fan connection.

### Actuator

**FPMZ-07-b**

### Actuator

**FPMZ-09-b**

### Actuator

**FPMZ-13-b**

See table on page 28

### Electro-pneumatic positioner

**FPAZ-14**

### Pressure control equipment

**FPAZ-16-bb-c**

Control range (bb): 05 = 0-500 Pa  
10 = 50-1000 Pa  
20 = 100-2000 Pa

Version (c): 1 = For one fan

2 = For two fans

### Pressure control equipment

**FPMZ-16-bb-c-d**

Control range (bb): 05 = 0-500 Pa  
10 = 50-1000 Pa  
20 = 100-2000 Pa

Version (c): 1 = For one fan

2 = For two fans

Type (d): 1 = Increase-Decrease

2 = 2-10V DC

### Flow measurement transmitter

**FPAZ-17**

For particulars of the measuring range, get in touch with your nearest Fläkt Woods AB representative

### Flow measuring tapping

**FPAZ-18-bb**

b = code suffix "a" in the fan code

### Control equipment for air flow control

**FPAZ-70-bb**

Control range (bb): 05 = 0-500 Pa  
10 = 50-1000 Pa  
20 = 100-2000 Pa

### Blade pitch indicator for FPAC

**FPAZ-19**

### Blade pitch indicator for FPMC

**FPMZ-19**

### Note

The motor should be specified separately as described on pages 34-39. The fans are designed for being driven by ABB motors, but a quotation can be submitted for equipping the fan with a motor of any other manufacture. However, if a different motor is selected, the order must always be accompanied by a drawing showing the dimensions of the relevant motor. In the case of arrangements 1 and 6, the outside dimensions of the motor must not be larger than those of the corresponding ABB motor, and the thrust-carrying capacity of the bearings must not be lower. For arrangements 1 and 6 the outside dimensions of the motor must not be larger than the hub diameter of the corresponding fan, since the fan performance may otherwise be affected. This applies to motor sizes IEC 225, 250 and 280 for hub diameters 5, 6 and 8 respectively. For arrangement 6, sizes 280 and larger motors must have permanently connected cables without terminal box in accordance with Fläkt Woods AB drawing no. V 2608656.

**Acoustic data**

The acoustic particulars are valid within the tolerances specified by AMCA for operating points within the marked efficiency lines and for blade angles up to 55° (see the fan charts).

The total A-weighted sound power level to the ducting for arrangements 1 and 7 (L<sub>wt</sub>) can be read from the fan charts.

Other sound data can be calculated on the basis of L<sub>wt</sub>.

The sound data for arrangement 3 and for arrangements 1 and 6 with large motors ( see remarks on page 21) can be obtained on request from your nearest Fläkt Woods AB representative.

**Octave band levels**

The following method of calculation is used for obtaining the acoustic data at octave band levels for arrangements 1, 6 and 7.

L<sub>wt</sub> = total A-weighted sound power level to the ducting for arrangement 1 or 7. Read from the chart.

L<sub>wa</sub> = sound power level per octave band to the ducting.

L<sub>wb</sub> = sound power level per octave band to the surroundings for a free inlet installation.

L<sub>wc</sub> = sound power level per octave band to the surroundings for a ducted fan. Arrangement 6.

**Formulae:**

$L_{wa} = L_{wt} + k_{oka}$

$L_{wb} = L_{wt} + k_{okb}$

$L_{wc} = L_{wa} + k_c$

**Total sound levels**

If only A-weighted total levels are required, a simple method of calculation can be employed.

L<sub>wt</sub> = total A-weighted sound power level to the ducting for arrangement 1 or 7. Read from the chart.

L<sub>wbt</sub> = total A-weighted sound power level to the surroundings for a free inlet installation. Arrangement 1 or 7.

L<sub>wct</sub> = total A-weighted sound power level to the surroundings for a ducted fan. Arrangement 6.

L<sub>wdt</sub> = total A-weighted sound power level to the ducting with a sound absorber or sound-attenuating diffuser.

k<sup>c</sup><sub>dBA</sub> = attenuation in dB(A) of the fan casing.

k<sup>d</sup><sub>dBA</sub> = attenuation in dB(A) of the FPAZ-24 sound absorber and FPAZ-25 diffuser.

L<sub>wt</sub> and L<sub>wbt</sub> for arrangement 6 is slightly higher (max. 1 dB) than those for arrangement 1.

**Formulae:**

$L_{wbt} = L_{wt}$

$L_{wct} = L_{wt} - k^c_{dBA}$

$L_{wdt} = L_{wt} - k^d_{dBA}$

**Correction factors for sound to connected ducting and the surroundings of free inlet installation.**

**980 rpm fan speed, arrangements 1 and 7**

**Acoustic data for FPAZ-24 silencer**

The silencer can be delivered with or without central core (see the ordering key on page 21). The central core is specially suited to each hub diameter. Table 1 below can be used as a guide for selecting a silencer.

**Table 1**

		Without central core	With central core
1 silencer	Attenuation Pressure drop	about 10 dB(A) None	about 15 dB(A) Low
2 silencers installed in line	Attenuation Pressure drop	about 15 dB(A) None	about 20 dB(A) Moderate

The particulars specified are applicable to a silencer fitted to the fan outlet. When fitted to the fan inlet, the attenuation will increase by 1 - 2 dB(A). The change per individual octave band will be somewhat greater.

**Table 2. Acoustic data for an FPAZ-24 silencer**

Size <sup>1)</sup> bbb-c	Attenuation, dB Octave band, mid-frequency, Hz								k <sup>d</sup> <sub>dBA</sub> dB(A)	Pressure constant z

140-0	1	4	12	14	13	12	12	12	12	0
140-6	0	4	14	19	18	17	15	15	17	0.24
140-8	0	4	15	18	19	18	16	14	17	0.42

<sup>1)</sup> bbb = size of silencer  
 c = 0 = without central core  
 c = 5, 6, 8 = with central core for hub diameter 5, 6, and 8 resp.

The pressure drop can be calculated from the formula  $\Delta p = z \times p_d$ . The value z can be obtained from tables 2 and 3.

**Worked example**

**Given**

Determine the sound power levels to the inlet and to the outlet duct for an FPAC-7-125-6-8 fan running at a speed of 1470 r/min. Operating point of the fan: total pressure rise of 1388 Pa, flow of 30 m<sup>3</sup>/s and air density of 1.2 kg/m<sup>3</sup>. Also calculate the sound power level to the outlet duct if an FPAZ-25 diffuser with sound attenuation is installed.

**Solution**

	Octave band, mid-frequency, Hz								Total dB(A)
	63	125	250	500	1000	2000	4000	8000	
L <sub>wt</sub> [dB(A)] <sup>1)</sup>	115	115	115	115	115	115	115	115	-
k <sub>okb</sub> (dB) <sup>2)</sup>	-16	-14	-7	-6	-3	-7	-12	-14	-
L <sub>wb</sub> (dB) <sup>3)</sup>	99	101	108	109	112	108	103	101	115
k <sub>oka</sub> (dB) <sup>4)</sup>	-13	-14	-7	-6	-3	-7	-13	-17	-
L <sub>wa</sub> (dB) <sup>5)</sup>	102	101	108	109	112	108	102	98	115
Acoustic diffuser <sup>6)</sup> FPAZ-25-125-6	-2	-5	-8	-12	-15	-11	-7	-4	-
L <sub>wa</sub> down-stream <sup>7)</sup> of acoustic diffuser	100	96	100	97	97	97	95	94	103 <sup>8)</sup>

- L<sub>wt</sub> = 115 dB(A) in accordance with the example on page 8.
- k<sub>okb</sub> can be read from the table on page 23.
- L<sub>wb</sub> = L<sub>wt</sub> + k<sub>okb</sub>, i.e. line 1 + line 2.
- k<sub>oka</sub> can be read from the table on page 23.
- L<sub>wa</sub> = L<sub>wb</sub> + k<sub>oka</sub>, i.e. line 1 + line 4.
- The attenuation data can be read from the table above.
- Line 5 + line 6
- The total sound power level downstream of the acoustic diffuser is  
 $L_{wt} - k^d_{dBA} = 115 - 12 = 103$ . k<sup>d</sup><sub>dBA</sub> can be read from the table above

**Silencer and sound-attenuating diffuser**

The sound attenuating properties of sound-attenuating accessories and the pressure drops across them are measured directly as a reduction in sound power level and total pressure respectively when the accessory is mounted at the fan outlet. (A usual but inferior alternative is to employ a loudspeaker instead of a fan as the sound source). The performance of a sound-attenuated fan has been determined by AMCA 210 - 85 and AMCA 300 - 85 measurement methods.

**Dimensions and weights**

**Accessories**

**EBGA/EBGG flanges and EBGV grouting-in frame**

Circular, geometric size series.  
The flanges are designed according to ISO 6580, which is equivalent to EUROVENT 1/2.  
For particulars of finish, see the ordering key.

**EBGA** - Flat bar flange, steel

**EBGG** - Angle flange, steel

**EBGV** - Grouting-in frame, steel (with dome nuts)

Sound pressure level and sound power level

The sound pressure level  $L_p = 10 \log \left( \frac{p}{p_0} \right)^2$  dB

where p = the actual sound pressure and  $p_0 = 2 \times 10^{-5}$  Pa.

The **sound pressure level**, however, is not an absolute measurement of the acoustic characteristics at a sound source, since the acoustic design of the premises influences the sound propagation. It is therefore in general easiest to specify the **sound power level** instead of the sound pressure level for a given sound source. Since the sound power level is not directly measurable, it must be calculated from a sound pressure level, which has been measured under known acoustic conditions. If no reverberation occurs (difficult to achieve indoors!), the sound pressure level will decrease 6 dB as the distance from the sound source is doubled.

Frequency weighting filters

An amplifier and various filters are used for measuring the composite sound. By this method, the dB-values measured are specified with the suffix (A), (B) or (C) depending on the type of filter used. Normally only dB(A) values are specified which best correspond to sound perceived by the human ear.

Torque

$$M = F \times r \quad M = \frac{9550 \times P}{n}$$

where M = torque in Nm  
 F = force in N  
 r = leverage (radius) in m  
 P = power in kW (motor)  
 n = speed, rpm

Definition of fan efficiency

$$\eta = \frac{P}{P_e} \times 100\%$$

where  $P_e$  is the power demand and P is the theoretical power from

$$P = \frac{q \times \Delta p_t}{1000} \text{ kW,}$$

where q is in m<sup>3</sup>/s and  $\Delta p_t$  in Pa.

Gas flow

The gas flow in the fan chart always refers to the actual flow at the fan inlet. If the required gas flow has been specified at a temperature and pressure which deviates from the temperature and pressure prevailing at the fan inlet, the flow at the fan inlet is determined from:

$$q = q_1 \times \frac{T}{T_1} \times \frac{P_{a1}}{P_a}$$

Where T<sub>1</sub> and P<sub>a1</sub> are the temperature and pressure that deviate from the temperature T, and pressure, P<sub>a</sub>, that prevail at the fan inlet.

The required gas flow = q<sub>1</sub>. The gas flow at the inlet = q.

Fan performance at a different speed

If the fan speed is changed but the installation is otherwise unaltered, the gas flow, pressure rise and power level will be affected as follows:

$$\frac{q_1}{q_2} = \frac{n_1}{n_2} \quad \frac{\Delta p_{t1}}{\Delta p_{t2}} = \left( \frac{n_1}{n_2} \right)^2 \quad \frac{P_1}{P_2} = \left( \frac{n_1}{n_2} \right)^3$$

Using the fan chart

Unless otherwise specified, the **total pressure rise**  $\Delta p_t$  and power demand P shown in the fan chart always apply to a gas density of 1.2 kg/m<sup>3</sup> at the fan inlet, and this corresponds to the density of air at 20°, a normal barometric pressure of 1013 mbar (760 mm Hg) and a relative humidity of 50%.

If the density  $\rho$  of the gas deviates from 1.2 kg/m<sup>3</sup>, the required total pressure rise  $\Delta p_t$  used in reading the chart must be corrected as follows:

$$\Delta p_{t\text{chart}} = \frac{1.2}{\rho} \times \Delta p_t$$

The fan speed and power demand  $P_{e\text{chart}}$  can then be read from the chart. Finally, the actual power demand is obtained from:

$$P_e = \frac{\rho}{1.2} \times P_{e\text{chart}}$$

The gas density  $\rho_0$  is often known at a temperature, T<sub>0</sub>, and a pressure, P<sub>a0</sub>, which differ from the temperature, T, and pressure, P<sub>a</sub>, at the fan inlet. The density at the fan inlet can be calculated from the formula:

$$\rho = \rho_0 \times \frac{T_0}{T} \times \frac{P_a}{P_{a0}}$$

**Electric motors**

This catalogue section deals with totally enclosed, footmounted, three-phase squirrel cage motors for 50 Hz.

The two-speed motors are adapted for driving fans.

Quotations for motors incorporating temperature sensors will be submitted on request.

APAL Single-speed motors

ARAL Two-speed motors, with speed ratio of 1:2 and one stator winding (Dahlander-coupled)

ATAL Two-speed motors, with speed ratio 1:1.5 and separate stator windings

**Determination of the starting time**

Whenever fans or fan drives are presented with a specific motor, this is rated for **direct on-line starting**. If a different motor is selected or if a star-delta start is employed, the starting time must be checked by calculation.

Use the following formulae to calculate the starting time for direct on-line and star-delta starting:

$$t = \frac{J \times n_f^2 \times 10^{-3}}{46 \left[ P \left( \frac{M_{max}}{M} + \frac{M_{st}}{M} \right) - P_f \right]}$$

**Star-delta starting**

$$t = \frac{J \times n_f^2 \times 10^{-3}}{46 \left[ P \left( \frac{1}{3} \times \frac{M_{max}}{M} + \frac{1}{4} \times \frac{M_{st}}{M} \right) - P_f \right]}$$

**Permissible starting time**

The maximum permissible starting times for an individual start with the motor in cold condition are tabulated below.

Motor size	Method of starting	Max. starting time, seconds for an individual start	
		Number of poles	
		4	6
132	Direct on-line starting	12	20
	Star-delta starting	36	60
160-225	Direct on-line starting	15	20
	Star-delta starting	45	60
250	Direct on-line starting	15	20
	Star-delta starting	45	60
280	Direct on-line starting	18	17
	Star-delta starting	54	51
315	Direct on-line starting	18	16
	Star-delta starting	54	48
355	Direct on-line starting	20	18
	Star-delta starting	60	54

In most cases, it must be possible to restart a motor immediately after it has stopped. A good rule is therefore to utilise only one-third of the starting time listed in the table.

**NOTE!**

A star-delta starter may be used for starting a motor, provided that the motor is delta-coupled. During the starting process, the motor is star-coupled, and the torque it develops is therefore reduced. Check that the torque curve of the motor is higher than the torque curve of the fan up to 90% of the synchronous speed. If no torque curves are available for the motor, the following formula can be used with adequate accuracy for determining the minimum motor rating.

$$P_{Y/D} = \frac{2.6}{M_{max}} \times P_f \times M$$

If star-delta starting is employed, the starter should be set to the star setting for a period of time corresponding to the starting time calculated as described above, and should then be switched over to the delta setting.

**Symbols used**

- P = rated output of the motor ..... kW
- P<sub>f</sub><sup>1)</sup> = fan power demand at rated speed (incl. belt-drive losses if the fan is belt-driven ..... kW
- P<sub>Y/D</sub> = Minimum motor rating at which star-delta starting is possible ..... kW
- $\frac{M_{st}}{M}$  = ratio of motor starting torque to normal torque
- $\frac{M_{max}}{M}$  = ratio of max. motor torque to normal torque
- n<sub>f</sub> = rated speed of fan ..... r/min
- J = moment of inertia of the system, referred to the fan shaft<sup>2)</sup> ..... kg m<sup>2</sup>
- t = starting time ..... s

1) Also specified as P<sub>M</sub> in other catalogue sections.

2) The moment of inertia of the fan impeller is specified in the appropriate fan chart. The moment of inertia of the motor can normally be neglected.

**Ordering key**

**Motor, single-speed**

**APAL-a-bbbbbb-c-0**

**Motor, two-speed**

**speed ratio 1:1.5**

**ATAL-a-bbbbbb-c-0**

**speed ratio 1:2**

**ARAL-a-bbbbbb-c-0**

Number of poles<sup>1)</sup> (see motor tables): 4, 6

Rated output<sup>1)</sup> (see motor tables): The first three digits of code suffix b specify kW in integers, and the last two are decimals. Example: Code suffix 00175 denotes 1.75 kW.

Supply voltage

**Single-speed motor**

1 = 220-240 V delta/380-420 V star (sizes 63-250)<sup>2)</sup>  
220 V delta/380 V star (sizes 280-355)<sup>2)</sup>

2 = 380-420 V delta (sizes 63-250)  
380 V delta (sizes 280-355)

4 = 415 V delta (sizes 280-355)

5 = 500 V star (sizes 63-100), 500 V delta (sizes 112-355)

**Two-speed motor**

2 = 380 V 5 = 500V

1) For the higher speed of a two-speed motor.

2) Star-delta starting is not possible if the motor is star-wired.

IEC sizes 200-250

IEC sizes 280-355

Motor shaft

For fan arrangement 6, size 280-400 motors must have permanently connected cables (without terminal box) arranged on the opposite side as that shown in the left-hand views above.  
The cable length outside the motor should be 1.5 m.
